WHY PLAY RISKSCAPE ?

Cyberattacks frequently target critical infrastructures and are now more interconnected than ever—both geographically, across sectors, and society. A failure in one system can trigger a cascading effect, posing serious risks to national security, fiscal stability, public health, and safety.

***RiskScape* engages players through a multi-layered security first approach, introducing modern defensive technologies and processes in a fun, and interactive format.**

RiskScape is a **2 or 4 player** strategy card game in which they take on the role of stakeholders/employees of a critical infrastructure that faces cyber threats from malicious actors.

The game entails an 84-card deck that includes ***Threat, Protect, Challenge, Verify, Defence,*** *and* ***Action cards***. Players must cooperate to respond & resolve various threats; if left unresolved, these can escalate into attacks triggered by Action cards.

Players lose immediately if an attack reaches the final level of infrastructure —***Physical Processes***. They win by exhausting all Threat cards before any attack escalates to this level.

At the end of the play session, the game generates a unique case study for post-game discussion. A typical game lasts approx. **30-45 minutes.**

GAME ELEMENTS

1. Cards Deck (84)
   - Threat cards (12)
   - Protect cards (38)
   - Challenge cards (6)
   - Verify cards (6)
   - Defence cards (6)
   - Action cards (16)
2. Game Tracker Sheet
3. Play Guide

Play Duration: 30 - 45 minutes

Players: 2-4

LEARNING OBJECTIVES

- The 3 suits in the game are the objectives of cybersecurity: ***Confidentiality, Integrity*** and ***Availability***. The players discern that a cyberattack seeks to compromise at least one of the three.
- Players apply ***the Principle of Least Privilege***, as attacks target technologies with high Privilege needs.
- Players identify common and contemporary Social Engineering Tricks to progress in the game.
- Players recognise the importance of ***Access Control*** and ***Segmentation*** in a Zero Trust framework.
- Players realise the need for collaboration between stakeholders to ***Identify, Protect, Detect, Respond and Recover (NIST framework***) from modern cyberattacks.

TARGET AUDIENCE

- **Primary:** Stakeholders of critical infrastructures such as Data Centres, Smart City Control & Command Centres, Airports, Utility Grids, Integrated Urban Metropolitan Transport Control Centres etc.
- **Secondary:** Educators, trainers and hobbyists who enjoy playing strategy and collaborative games.
